

## METADATA

**Title:** Database Systems Volume B

**Other Titles:** -

**Language:** Greek

**Authors:** Skourlas, C., Professor Emeritus, UNIWA

**ISBN:** 978-618-228-164-2 (T. B) 978-618-228-162-8 (set)

**Subject:** MATHEMATICS AND COMPUTER SCIENCE

**Keywords:** Databases, Database systems / Relational model, Relational algebra, Relational databases / Database Design / Database modeling, Entity Relationship Model / Database normalization

**Bibliographic Reference:** Skourlas, C. (2024). Database Systems Volume B [Undergraduate textbook]. Kallipos, Open Academic Editions. <http://dx.doi.org/10.57713/kallipos-973>

### Abstract

The book meets the need for an electronic textbook that will include: 1) a presentation and discussion of the "theoretical" issues, 2) a study of database programming with interesting examples, and 3) a list of case studies characterized by a global and, as much as possible, interdisciplinary approach to database systems. It is aimed at undergraduate students and professional IT engineers who want to develop their skills in database application design and programming, as well as postgraduate students of business administration, librarianship, archival and information studies, as well as other fields, who are interested in applications of database systems. It also aims to solve data management

problems and meet the needs of professionals in the field. The subject of the book is not only the study and exploitation of established directions, tools and technologies that are popular in the context of database systems, but also new promising technologies, such as big data management. The book includes twelve chapters written so that each one can be read separately, independently of the others. Effort has been made so that even the chapter units, examples and topics can be studied (and tested on a computer) independently. The book's introduction includes suggestions for navigating the book's chapters and scenarios for using it in the context of one or two undergraduate semester courses.
