Abstract

This is an undergraduate book about the clinical anatomy of the musculoskeletal system. Through 250 pages and 239 images, the anatomy of the musculoskeletal system is presented in a concise way, but particularly targeted and comprehensive, covering all the information that the student of medicine, physical therapy and nursing needs to know in order to continue their studies. The material of the book is classified into five chapters, following topographical criteria. An effort has been made so that the anatomy of the musculoskeletal system is

not disconnected from clinical practice and the patient. In order to achieve this, clinical extensions and correlations of the anatomy are presented, in order to make the subject more understandable and to be connected with the pathology presented by the musculoskeletal system. Clinical information is presented in different characters so that it is distinct and facilitates the student's study. In this way, the student realizes the usefulness and necessity of good knowledge of anatomy and is facilitated so that his knowledge is consolidated.
